BASIC-ABSTRACT:

NOVELTY - A method for continuously preparing a nanocomposite is provided to control dispersion of the composition as desired under regulation of pressure change within a continuous mixer and admixing degree by using a supercritical fluid and a melt compounding approach.

DETAILED DESCRIPTION - The method in principle comprises intercalating a melt polymer chains into a laminated clay compound and mechanically blending the intercalated material to form nanocomposites. The composite is an organic laminated clay compound dispersed in a polymer medium. The method comprises particularly steps of introducing the polymer medium and the clay compound into a continuous admixer (1) consisting of a solvent inlet (2), a solvent recovering part or a deaeration part (5); introducing a low molecular weight solvent (3) into the admixer to mix the polymer medium and the clay compound (4); and recovering all and/or part of the low molecular weight solvent (6).
